

Sketches of Temporal Data

① LUNAR CYCLE (cyclical)

$\frac{1}{4}$: inner circle = 1 full moon cycle
 $\frac{1}{2}$: 2nd circle = new to full moon
 $\frac{1}{4}$: 3rd circle = new to half or half to full or full to half or half to new
 $\frac{1}{8}$: 4th/outer circle = each moon drawing

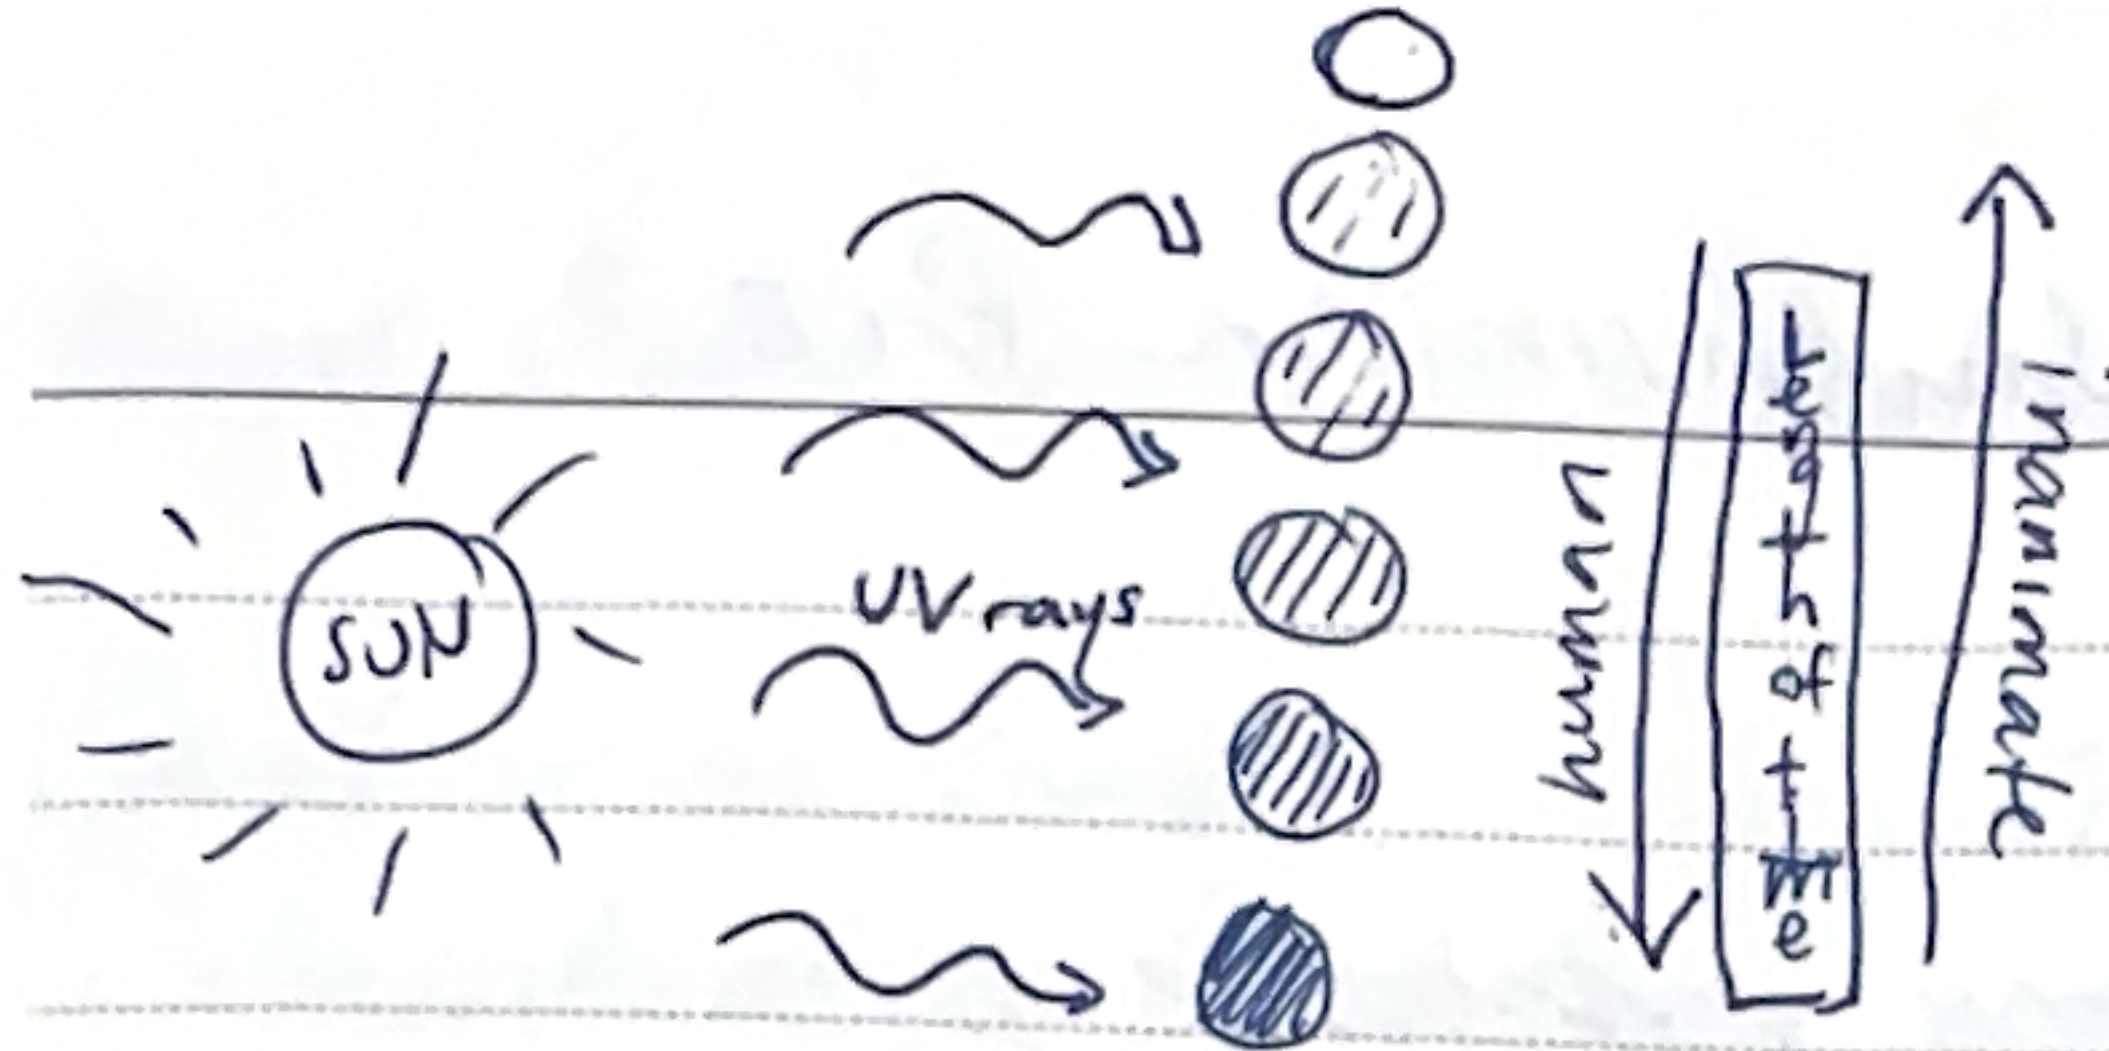

cellular reproduction
 but correlated to an area.
 → time it takes to fill a predetermined container if each cell represented ^{area} ~~area~~
 → limitation being cells have consumed all available resources and cannot split again.

③ Light?

→ length = time for the star's light to reach earth

imagine these lines were straightened
 *not to scale.

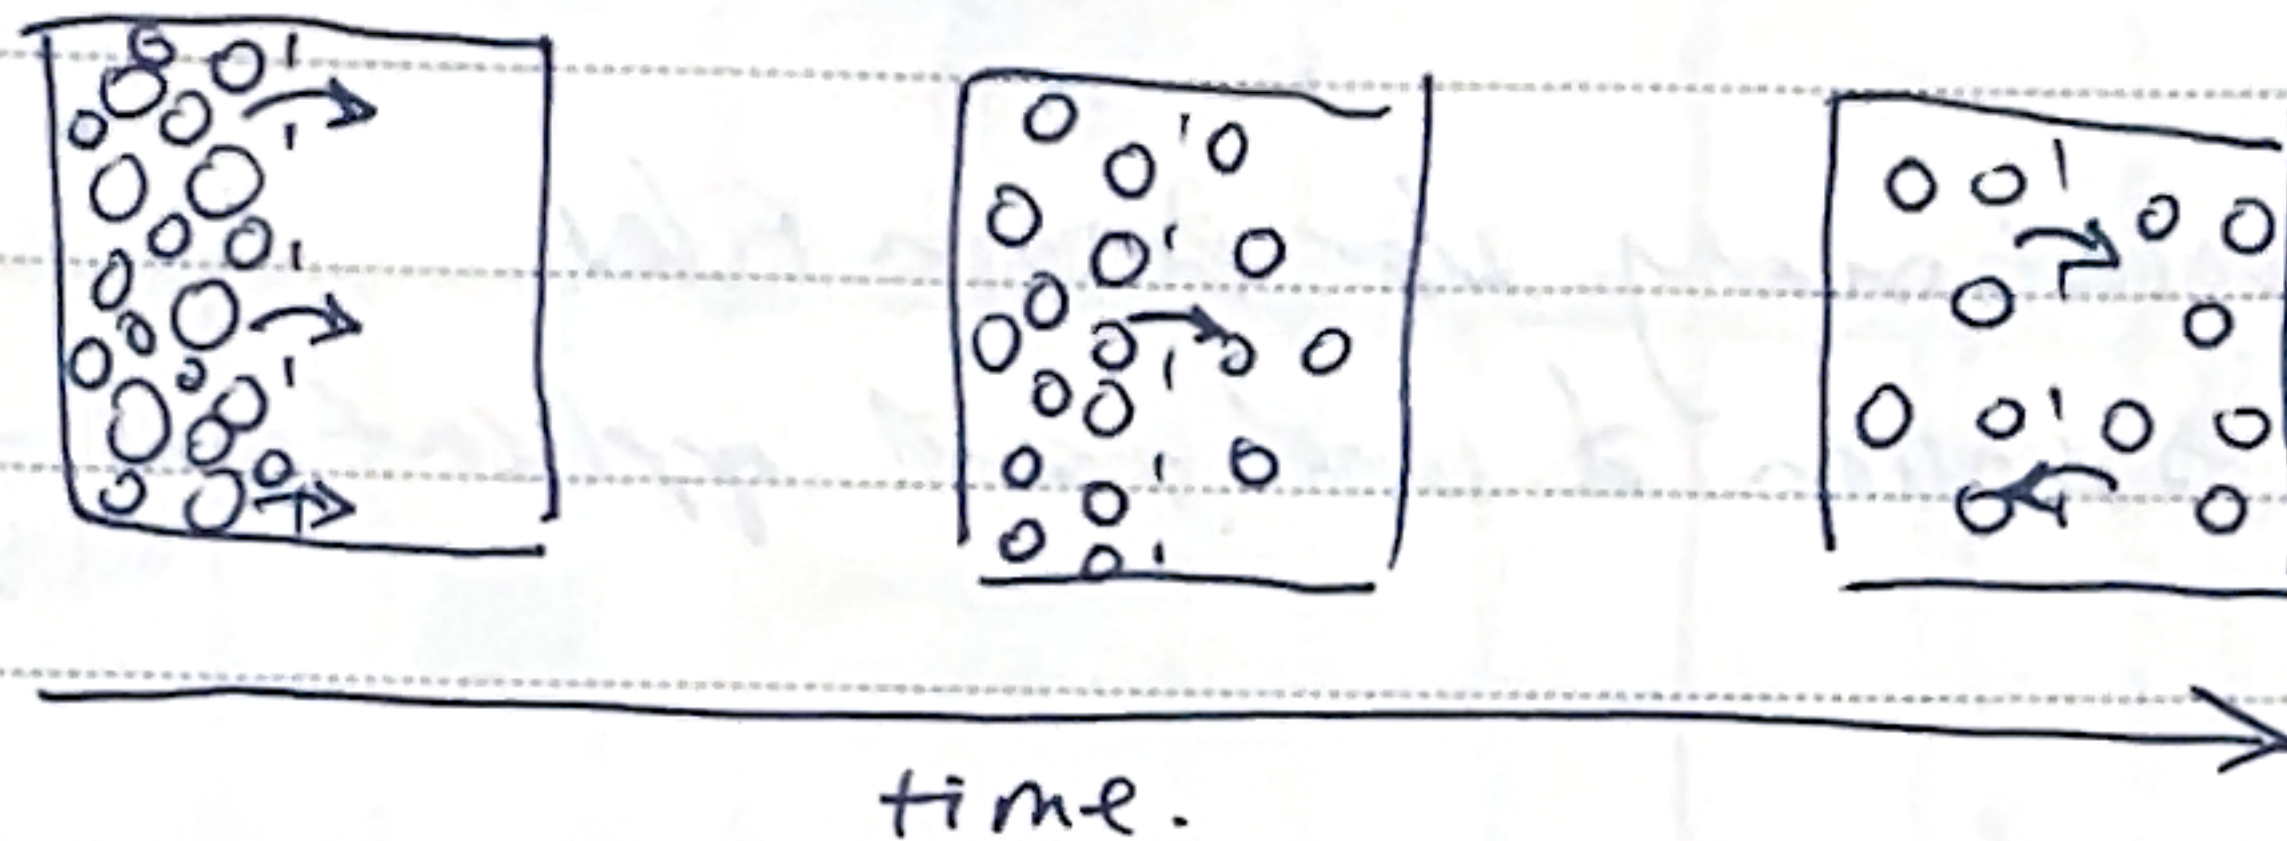

Date.

Page.

direction depends on how you read UV effects. If human, skin gets darker w/ more sun $\rightarrow$ more time passed. If object, surface gets bleached by UV & becomes lighter.

④ Exposure to the sun.

⑤ Equilibrium

• time taken to reach equilibrium.

• has to start w/ highly concentrated state + membrane + container.

• unidirectional, unless some external force resets it.
